

# Siemens HiPath 3000 – flexible and scalable communication

A flexible communications platform for small and medium-sized businesses that scales up to 500 users. The HiPath can support any combination of TDM, analogue and IP telephones, PC clients and cordless phones making it ideal for heterogeneous environments.

## Key benefits

- Multi-site networking allows businesses with remote sites to operate it as one system
- Lower call charges by using IP telephony between sites or over the Internet
- Access to industry-leading telephony features in TDM or IP environments.

## Just like a single network

Fixed Mobile Convenience (FMC) consolidates all of an employee's phones (including office, mobile or home office phones) to create a single unit. This makes FMC the ideal solution for companies looking to increase flexibility and improve integration of mobile employees.

## One Number Service

Employees can be reached on their mobile or home office phones via their office number. When calls are made from a mobile or home office phone, the office number is displayed as the calling line identification.

## Only one mailbox required

A single mailbox can assume the answering machine function for all phones. This makes it easier to provide callers with up-to-date information and ensures that their messages are more reliably received.

## Busy display for mobile calls

The busy status for internal subscribers is shown (depending on the solution variant) for as long as the mobile subscriber is conducting a call.

## Protecting privacy

Employees can configure where and when they are reachable when they are not in the office, easily separating working hours and private time.

## Office phone to go

A wide range of tasks can be performed immediately while on the move. FMC allows users to quickly transfer calls to colleagues, the secretary, or representatives from a mobile or home office phone as easily as in the office (depending on the solution variant). Callbacks are no longer necessary and calls can always be answered.

## Changing phones during a call

Users are no longer tied to their desks for even the most important calls. A call that has been accepted on a mobile phone can be continued, without interruption, on a fixed line phone (depending on the solution variant), giving users more freedom and room to work.

## Conferencing from your mobile phone

Conferences enable several participants to reach agreements fast without making multiple calls. FMC lets users participate in conferences while on the move.

## Cost control

The HiPath system reduces costs for mobile calls by automatically calling back the GSM phone and by setting up the call via the fixed line network. This can save a lot of money on international calls in particular.
